Data Preparation and cleaning

Getting the missing values percentages

```
##   Number_Missing Missing_Rate      Variable
## 1           7087      56.53318      enrollment
## 2           7087      56.53318      employment
## 3           9448      75.36694 employment_type
## 4           9448      75.36694 weekly_work_hrs
## 5           7361      58.71889      ethnicity
## 6           7383      58.89438      gender
```

```
## [1] 5018  22
```

missing value treatment

Method I

Treating imbalance classification

```
library(ROSE)
data_pad_balance<-ovun.sample(FI_q28 ~ ., data = data_pad, method = "both", p=0.5,
dim(data_pad_balance)
```

```
## [1] 5018  22
```

Converting predictors to category

Partitioning data set

```
## [1] 3364  22
```

```
## [1] 1654  22
```

The training data has 76 observations with 1887 now (old =1057 when compared) variables. The testing data has 32 observation with 1887 now (old= 1057 when compared) variables.

Model fitting

```
#----- Model building -----  
# Create a wrapper function to abstract away the common aspects of model fitting  
formula<- FI_q28~.  
fit.model <- function(method, tunegrid="", data=NULL, formula=NULL) {  
  
  data <- training  
  if(is.null(formula)) formula<- FI_q28~.  
  
  # Train the model  
  train(  
    formula,  
    data = data,  
    method = method,  
    trControl = trainControl(method = "cv", 5),  
    preProcess = c("center", "scale"),  
    tuneGrid = tunegrid)  
}
```

```
# Logistic Regression  
log <-train(formula,  
            data=training,  
            method="glm",  
            family = binomial(link = "logit"),  
            trControl = trainControl(method = "cv", 5),  
            preProcess = c("center", "scale"))
```

```
# LDA  
lda <- train(formula,  
            data=training,  
            method="lda",  
            trControl = trainControl(method = "cv", 5),  
            preProcess = c("center", "scale"))
```

```
#----- Elastic Net Models -----  
# fit a LASSO model  
lasso <- fit.model("glmnet", expand.grid(.alpha=1, .lambda=seq(0,0.1,0.01)))  
  
# Fit a Ridge regression model  
ridge <- fit.model("glmnet", expand.grid(.alpha=0, .lambda=seq(0,0.1,0.01)))
```

```
# Bagging  
# bag <- fit.model("rf", data.frame(mtry=11))  
bag <- train(formula,  
            data=training,  
            method="rf",  
            trControl = trainControl(method = "cv", 5),  
            preProcess = c("center", "scale"),  
            tuneGrid = data.frame(mtry=11),  
            ntree = 1000)
```

```
# Random Forest
# rf <- fit.model("rf", data.frame(mtry=1:10))
# rf <- train(formula,
#             data=training,
#             method="rf",
#             trControl = trainControl(method = "cv", 5),
#             preProcess = c("center", "scale"),
#             tuneGrid = data.frame(mtry=1:10),
#             ntree = 1000)
```

```
#-----

# Support Vector Machine with linear kernel
set.seed(125)
trctrl <- trainControl(method = "cv", number=5)
svc <- train(formula, data = training, method = "svmLinear",
             trControl=trctrl, prob.model=T,
             tuneLength = 10)

```

Making predictions

```
# pred <- function(model){
#   model <- lasso
#   pred.test<- predict(model, testing)
#   misscal<- round(mean(pred.test != testing$FI_q28),digits = 2)
#
#   # test_pred_1 <- predict(model, newdata = testing, type= "prob")
#   # ROC_SR <- roc(testing$FI_q28, predictor = test_pred_1[,2])
#   # # # plot(ROC_SR, col="brown")
#   # AUC<-round(ROC_SR$auc, digits=4)*100 # AUC
#   # # text(x=0.4, y=0.25, paste("Area Under Curve = ", AUC, sep=""), col="blue", cex=1.2)
#   # AUC = 0
#   return(list(missclass=misscal))
#}
```

Metrics

```
library(mlr3measures)
# Create a custom confusion matrix with performance metrics
metrics <- function(model_object, response="", test_data=NULL) {
  # response = "FI_q28"
  # model_object <- log
  #
  if(is.null(test_data)) test_data <- testing
```

```

# make predictions
prediction <- predict(model_object, test_data)

target <- test_data[, response]

cmat <- confusionMatrix(prediction, target, mode = "prec_recall")

misscal<- round(mean(prediction != target),digits = 2)

# Returned outputs
return(list(
  accuracy = (1-misscal),
  mcr = misscal,
  sens = round(cmat$byClass[1],2),
  spec = round(cmat$byClass[2],2),
  fbeta = round(cmat$byClass[7],2)
))
}

```

```
